

**FramMate  
PC Software**

New PC Windows based software allows users to change their controller's operating features without having to change the microprocessor chip. Easy to install and use, the FramMate software connects a PC or laptop computer to any 2000 or Predator™ control panel. Read, modify and update controller features any where, at any time. Select from 40 configuration options now included as standard PumpMate 2000 features or choose from a list of standard programs included with the installation CD. Call for a free FramMate™ CD and manual.

**Proportional  
Valve Control**

PumpMate 2000 controllers with a version 4.3 or higher microprocessor chip include the new Proportional Valve Control (PVC) feature as a standard option. The PVC feature allows any 2-valve PumpMate to dynamically monitor and control gas flow rate through any pneumatic, diaphragm operated motor valve. PumpMate PVC configurations allow both inversely proportional and directly proportional control modes to accommodate intermittently and continuously flowing well applications. The PVC feature requires a differential pressure (DP) transmitter and a PumpMate with dual solenoid valves installed. Applications include sales line flow control, chart spiking control and flow rate control on continuously flowing wells.

**EVS  
Update**

The fully implemented Enhanced Valve Switching (EVS) system technology, introduced in 2002, has met all expectations in terms of completely eliminating batteries as a source of problems in field portable equipment. With the EVS system, well head controller and performance under hot and cold weather extremes is no longer tied to the type and size of the battery used to power the controller. This results in greatly extending long-term reliability, twice the operating time from the same battery, extending the useful life of the battery and significantly reducing maintenance cost. The EVS system is gaining industry recognition as setting a new benchmark for well head controller reliability and performance.
